

Garlock

Pneumatic Valve Actuators

Garlock
an EnPro Industries family of companies

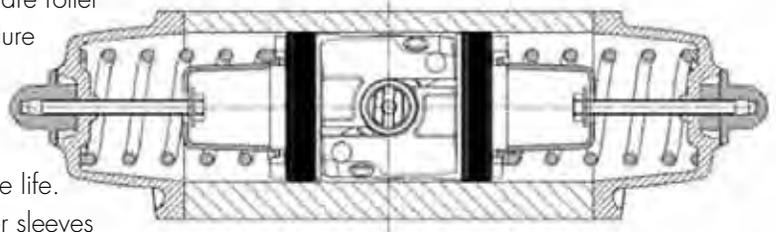

Our Actuator

The Garlock valve actuator includes a pneumatic piston actuating system for valves with 90° rotation. It features a robust anodized aluminum case as standard. Additional coating options such as nickel, PTFE, and epoxy resin are also available for special applications. All external screws and fasteners are made from stainless steel including the spindle. FPM O-rings ensure that the spindle seal is consistently and effectively maintained.

Internal three-bearing aluminum pistons generate the necessary force to provide smooth, positive and reliable actuation. The low-wear piston guide bands are also an important quality feature which reliably seals the pistons even with low levels of frictional resistance.

For all Garlock actuators the sliding surfaces of the pistons are roller burnished to a surface finish of less than 1 µm. This procedure results in an extremely smooth surface which offers an increased bearing area. The surface deformation evens out any abrasive edges in the material and in addition, the surface is cold-formed to promote extremely long service life.

Quality is also a feature of the deflection plate and cylinder sleeves which transmit the linear motion of the pistons to the spindle. These are manufactured from hardened steel which conforms to DIN and ISO standards. This choice of material reduces wear to a minimum.

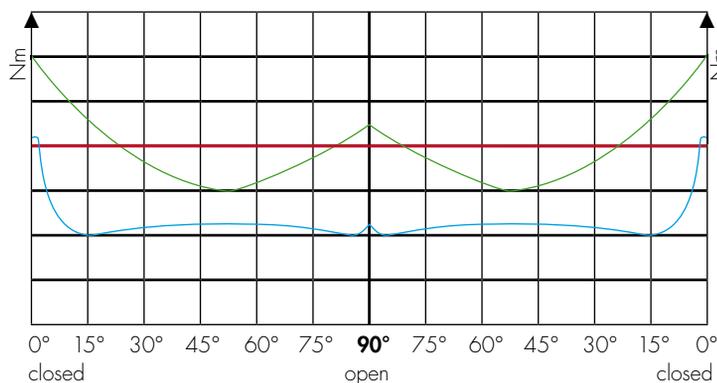

The integral case connection facilitates the direct mounting of Namur control valves without the necessity for additional assembly plates. The combination of these features results in the long and maintenance free service life of Garlock actuators. To highlight confidence in our products Garlock grant a warranty of two million switching cycles* and has conducted tests to validate and exceed the stated performance parameters.

The Scotch-Yoke principle

Garlock actuators use the high-quality Scotch-Yoke principle. In comparison to the rack and pinion principle, it features a torque up to 50% higher in the initial and final phase of the switching cycle, while the compressed air consumption is the same. Since this torque curve is adjusted to the valve, it generally allows for the use of actuators that are one type smaller than otherwise would have been used. It results in a **reduction in dimensions, weight, and compressed air consumption by approx. 30%** on average. The following depictions of torque curves show the difference between the Scotch-Yoke principle and the rack and pinion actuators.

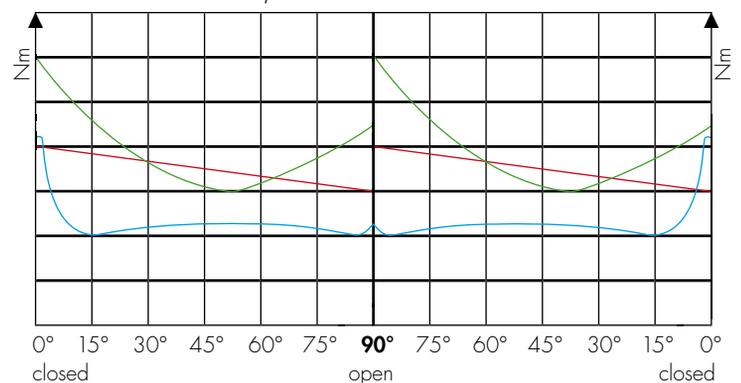

Double action:

GDA (in both directions due to compressed air)

Single action:

GSA (air-actuated in one direction, spring-actuated in the other direction)

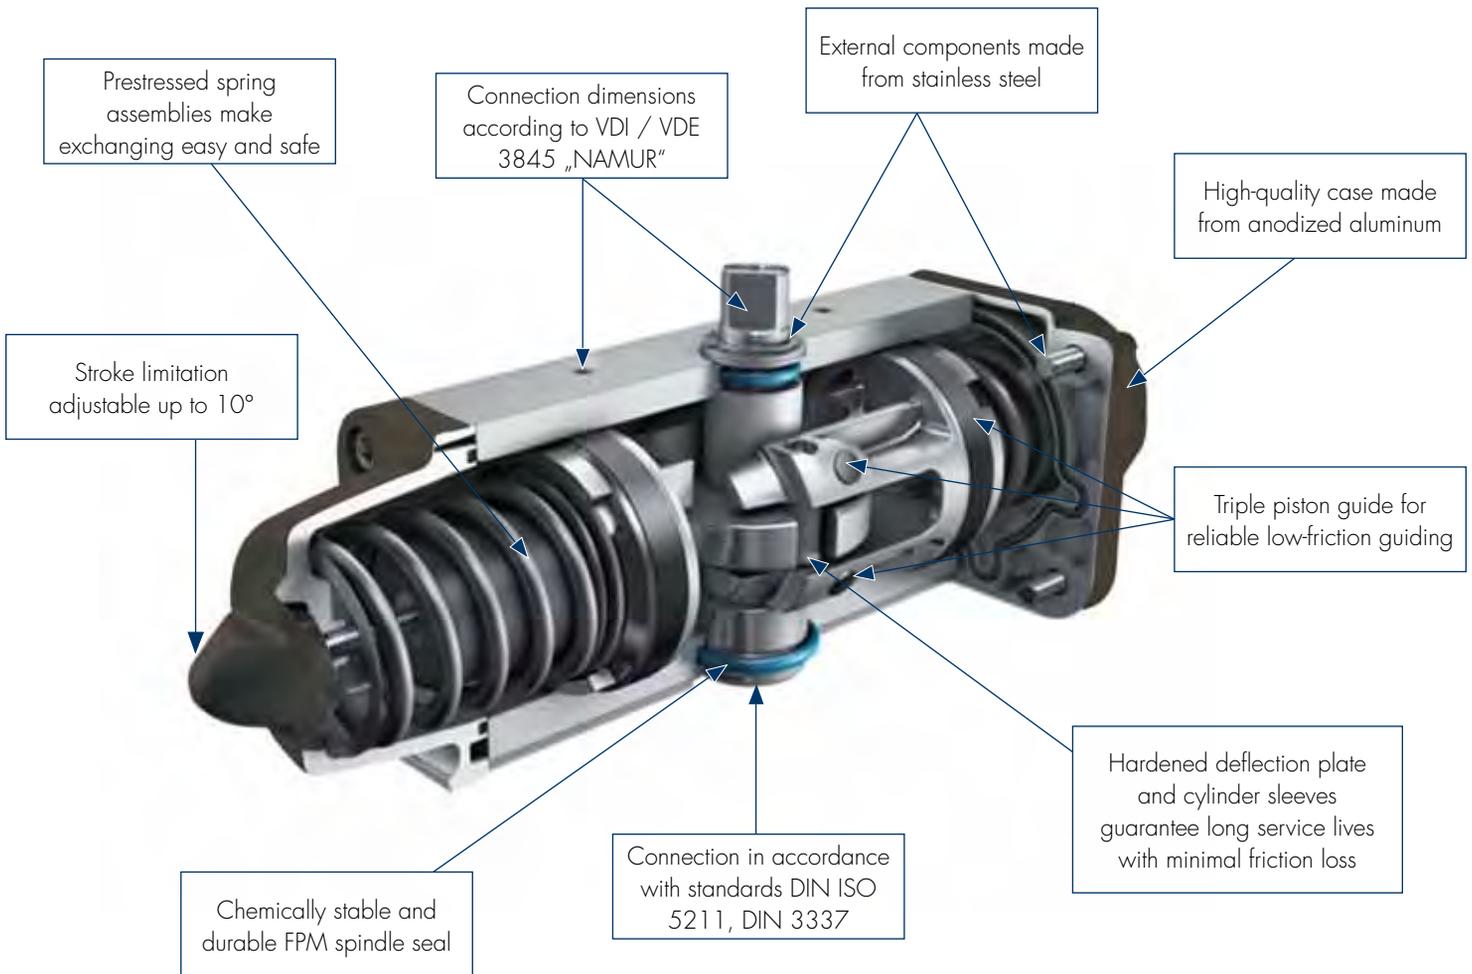

The diagrams show the torque of a Scotch-Yoke actuator (green line) and a rack and pinion actuator (red line) with equal levels of compressed air consumption. The initial torque and final torque of the Scotch-Yoke actuator and the torque curve adapted to the curve shape of a valve (blue line) are clearly visible. For the single-action actuators, the lever arm also affects the torque of the spring return, which is increased again near the final position. The Scotch-Yoke principle thus guarantees increased safety. Since the torque curve of the valves resembles that of other fittings (e.g. ball valve), the Garlock actuator is a good choice for those fittings as well.

*at 20 °C, clean & dry compressed air and 45% of the nominal torque.

Scotch-Yoke: All advantages at a glance!

Namur connection for solenoid valve integrated directly in the case.
No additional Namur assembly plate necessary!

Lower price, weight, and compressed air consumption

Technical Data	
Double action:	7 - 8000 Nm
Single action:	5 - 2600 Nm
Compressed air:	1 - 8.4 bar*
Temperature:	-20 °C to +80 °C
Stroke limitation:	10°
Flange connection:	ISO 5211
Attachments:	VDI/VDE3845

GDA double action pneumatic valve actuators

Garlock actuators of the GDA type are double action part turn valve actuators for 90° fittings, such as butterfly valves and ball valves. Compressed air is used for actuation in both directions.

The force of the air-actuated pistons is transmitted to the shaft using the Scotch Yoke principle.

In this method, the force is not transmitted using the gears of pistons and spindle but rather by means of a high quality lever arm system. Unlike in the rack and pinion system, the larger lever arm generates a significantly higher torque in the initial and final phases of the rotation, matching the torque curves of the fittings to be actuated.

- Namur hole pattern integrated in the case
- Increased torque
- Torque curve adjusted to fittings
- High-quality, robust aluminum case

GSA single action pneumatic valve actuators

Garlock actuators of the GSA type are single action part turn valve actuators for 90° fittings, such as butterfly valves and ball valves.

Compressed air is used for actuation in one direction, while spring force is used for actuation in the other direction. The force of the air-actuated pistons is transmitted to the shaft using the Scotch Yoke principle.

In this method, the force is not transmitted using the gears of pistons and spindle but rather by means of a high quality lever arm system. Unlike in the rack and pinion system, the larger lever arm generates a significantly higher torque in the initial and final phases of the rotation, matching the torque curves of the fittings to be actuated. The same applies to the spring force, which is the highest in the initial and final phases of the rotation.

The mounted spring sets can be recognized from the exterior by their formed end caps. This is how a single action actuator can be identified at first sight. The spring assemblies are mounted in a prestressed manner.

- Significantly higher torque in the initial and final phases of the rotation
- No risk of injury during dismantling due to prestressed spring assemblies
- Namur hole pattern integrated in the case
- Increased torque
- Torque curve adjusted to fittings
- High-quality, robust aluminum case

Mounting position	any
Rotation angle	90°
Adjustment range	10° of the final position at 0°
Rotation direction	opening to the left
Operating medium	oiled or non-oiled dry compressed air*

*for lubrication, a non-washing oil that is compatible with NBR may be used

Materials	
Case	Aluminum (standard version anodized)
Case lid	Aluminum (standard version anodized and varnished)
Shifter shaft	Stainless steel
Screws in the case	Stainless steel
Seals	NBR, FKM

Connections

Flange connection according to ISO 5211 / DIN 3337
 Connection for control valves according to VDI/VDE 3845 Namur
 Hole pattern according to VDI/VDE 3845 Namur: 30 / 80
 Shaft height: 20 mm

The matching accessories

The standardized connections for control valves and limit switches allow all products to be mounted according to customer specifications.

The standard selection of Garlock products includes the following types:

Direct-mount limit switch box

(only for sizes GDA15 to GDA720 and GSA15 to GSA360)

- Stop position indicators in sturdy PA6 polyamide box with integrated open/closed display
- Protection class IP 67, according to DIN EN 60529
- Cable gland M20 x 1.5 black (for cables Ø 6-12 mm)
- EPDM and NBR seals, stainless steel screws 1.4301

The device may be equipped with mechanical limit switches and proximity switches manufactured by Cherry, IFM, Pepperl & Fuchs, and Turck if desired.

Limit switch box with stainless steel bridge

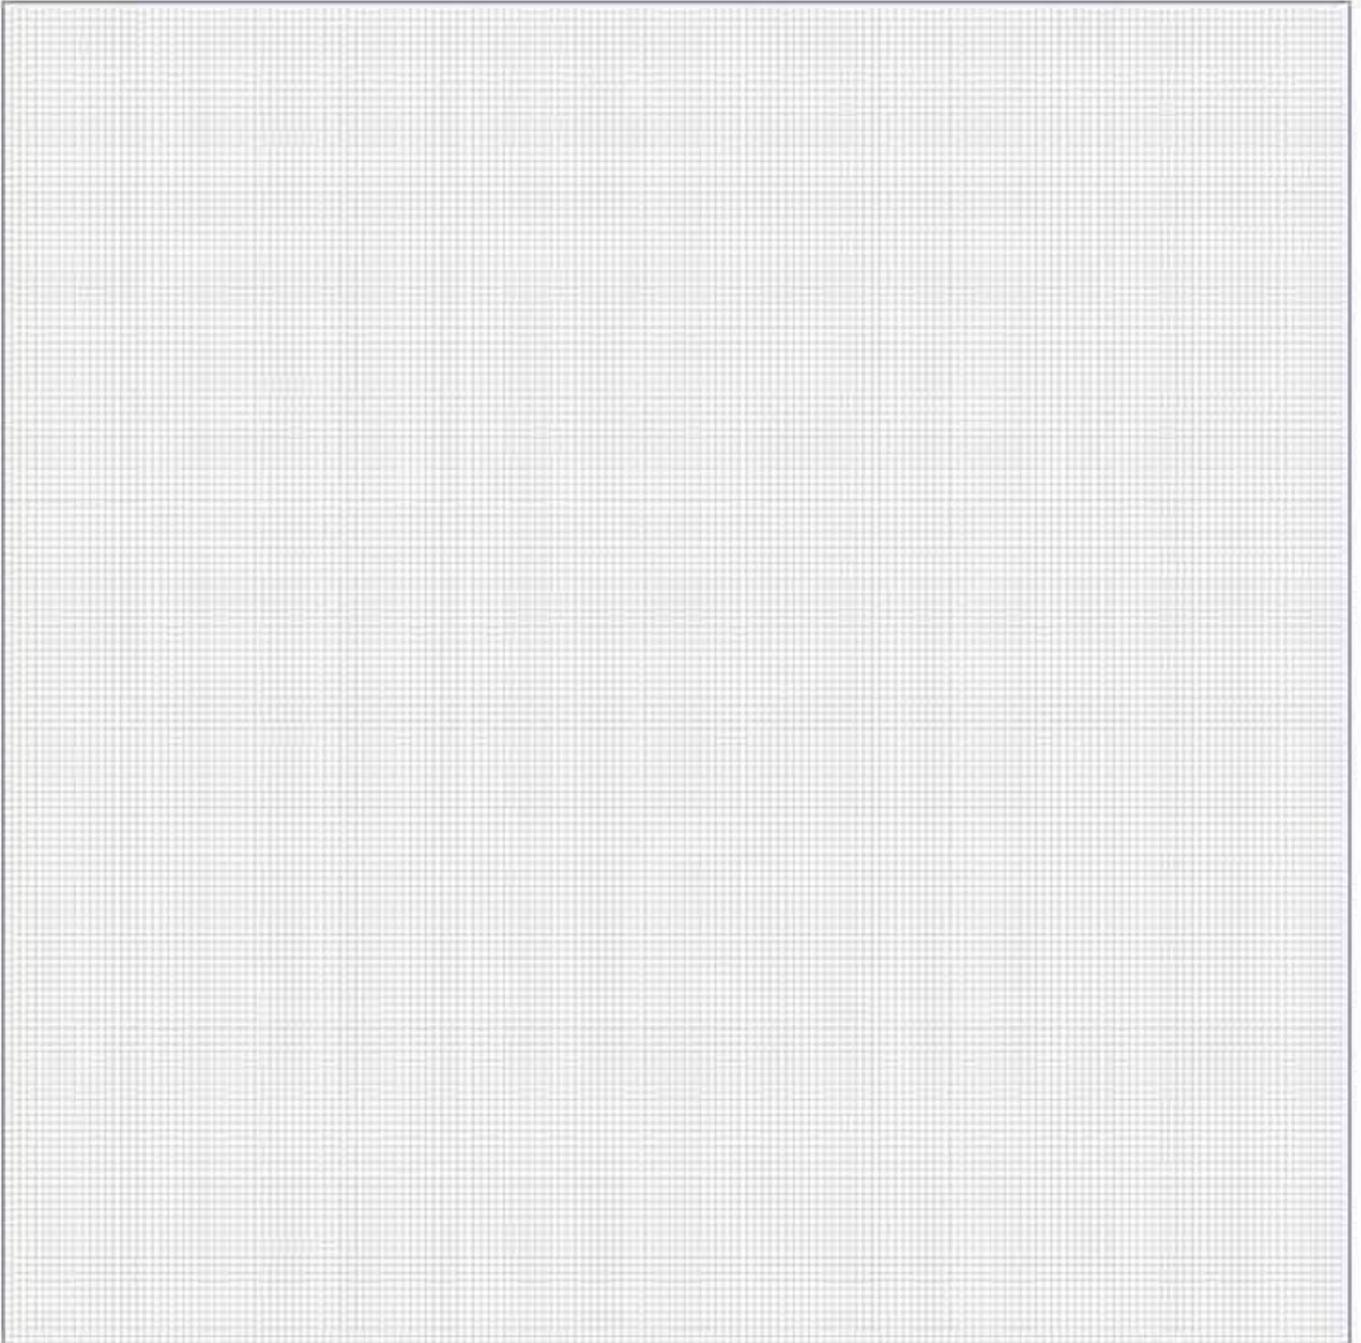

- Stop position indicators in sturdy PA6 polyamide box with transparent polycarbonate lid
- With integrated open/closed position display
- Protection class IP 67, according to DIN EN 60529
- Cable gland M20 x 1.5 black (for cables Ø 6-12 mm)
- Height adjustable mounting bracket made from stainless steel 1.4301
- EPDM and NBR seals, stainless steel screws 1.4301
- Stainless steel shaft made from 1.4301

The device may be equipped with mechanical limit switches and proximity switches manufactured by Cherry, IFM, Pepperl & Fuchs, Siemens, and Turck if desired.

As an alternative, limit switch boxes are also available with aluminum cases and in EEX design.
